

## ARE YOU A PROGRESSIVE LENS WEARER WHO WANTS IMPROVED VISION?

After 40, our eyes gradually lose the ability to focus up close. It's a natural evolution of sight called presbyopia.

The best way to regain the most accurate and natural vision is with progressive lenses. Progressive lenses allow you to see clearly in all fields of vision: far away, mid-range and up close, with no hard divisions in the lens (as in bifocals). Quality progressives let you move seamlessly from one field to the next, with no uncomfortable head or eye movements.

In 1959, Essilor invented the first progressive lens. Since then, we have followed a path of constant innovation to better answer the wearers' needs. Today, Essilor's progressive lenses provide limitless vision; wearers say: "I don't need to worry about going down the stairs anymore", "when I move my head, nothing moves around me", "I can enjoy reading without adjusting my head", "everything is clear at once; no need to adjust".
